Atlas of the Human Brain, Fourth Edition By Juergen K. Mai, Milan Majtanik, George Paxinos

The fourth edition of *Atlas of the Human Brain* presents the anatomy of the brain at macroscopic and microscopic levels, featuring different aspects of brain morphology and topography. This greatly enlarged new edition provides the most detailed and accurate delineations of brain structure available. It includes features which assist in the new fields of neuroscience – functional imaging, resting state imaging and tractography. *Atlas of the Human Brain* is an essential guide to those working with human brain imaging or attempting to relate their observations on experimental animals to humans. Totally new in this edition is the inclusion of Nissl plates with delineation of cortical areas (Brodmann's areas), the first time that these areas have been presented in serial histological sections.

- The contents of the Atlas of the brain in MNI stereotaxic space has been extensively expanded from 143 pages, showing 69 levels through the hemisphere, to 314 pages representing 99 levels.
- In addition to the fiber-stained (myelin) plates, we now provide fifty new (Nissl) plates covering cytoarchitecture. These are interdigitated within the existing myelin plates of the stereotaxic atlas.
- All photographic plates now represent the complete hemisphere.
- All photographs of the cell- and fiber-stained sections have been transformed to fit the MNI-space.
- Major fiber tracts are identified in the fiber-stained sections.
- In the Nissl plates cortical delineations (Brodmann's areas) are provided for the first time.
- The number of diagrams increased to 99. They were now generated from the 3D reconstruction of the hemisphere registered to the MNI- stereotaxic space. They can be used for immediate comparison between our atlas and experimental and clinical imaging results.
- Parts of cortical areas are displayed at high magnification on the facing page of full page Nissl sections. Images selected highlight those areas which are thought to correspond with those published by von Economo and Koskinas (1925).
- A novel way of depicting cortical areal pattern is used: The cortical cytoarchitectonic ribbon is unfolded and presented linearly. This linear representation of the cortex enables the comparison of different interpretations

of cortecal areas and allows mapping of activation sites.

- Low magnification diagrams in the horizontal (axial) and sagittal planes are included, calculated from the 3D model of the atlas brain.

Editorial Review

About the Author

Jürgen Konrad Mai studied medicine in Freiburg, Germany, Vienna and UT Southwestern Medical School, Dallas, U.S.A. Student and Medical practices in Freiburg (Clinic for Neurosurgery), Berlin and Düsseldorf. Dissertation ("summa cum laude") and habilitation were awarded by the University of Düsseldorf: After a period as GP in private practice (Titisee-Neustadt) he became scientific assistant and senior assistant at the C. and O. Vogt-Institute for Brain Research, University of Düsseldorf (1972 - 1983) and 1983 Professor of Neuroanatomy at the Institute of Neuroanatomy, H.-Heine-University of Düsseldorf. He served as director of the Department of the Institute of Anatomy 1 until retirement in 2011.

The main research interests are (i) the structural and molecular anatomy of the mammalian brain, especially of the human brain and (ii) expression patterns and regulation of terminal carbohydrates in development, cell activation and disease (III) operation planning in stereotactic neurosurgery. He works on a "Digital Brain Atlas for Planning and Interindividual Registration of Targets in Deep Brain Stimulation" and on a "Spatial Information Management Resource for the Human Brain". J. K. Mai has edited the catalogue of human brain sections from the Vogt collection; he is author and editor of several books, e.g. the awarded "Atlas of the Human Brain" with CD-ROM (Academic Press/Elsevier, San Diego), "The Human Nervous System" (Academic Press/Elsevier, San Diego, Amsterdam, 3rd ed. 2012), *Funktionelle Anatomie für Zahnmediziner* (Quintessenz, Berlin, 2nd. ed. 2008; Sensi Divini (ital., engl., ger, russ. eds). J. K. Mai is CEO of MR-X-Brain GmbH.

Milan Majtanik received his diploma in neuropsychology and training in neuroinformatics from the University of Bochum. He completed his diploma in mathematics and his PhD in psychology at the University of Düsseldorf. In his research at the Research Center Jülich he combined advanced analysis techniques in magnetoencephalography (synchronization tomography) with computational modelling in order to measure the impact of desynchronizing sensory stimulation on brain functions. His work on neural plasticity and desynchronizing neural stimulation provided framework for the development of novel therapeutic techniques. He is currently focusing on the development of novel algorithms for high precision mapping and analysis of individual MRI scans.

Professor George Paxinos, AO (BA, MA, PhD, DSc) completed his BA at The University of California at Berkeley, his PhD at McGill University, and spent a postdoctoral year at Yale University. He is the author of almost 50 books on the structure of the brain of humans and experimental animals, including *The Rat Brain in Stereotaxic Coordinates*, now in its 7th Edition, which is ranked by Thomson ISI as one of the 50 most cited items in the Web of Science. Dr. Paxinos paved the way for future neuroscience research by being the first to produce a three-dimensional (stereotaxic) framework for placement of electrodes and injections in the brain of experimental animals, which is now used as an international standard. He was a member of the first International Consortium for Brain Mapping, a UCLA based consortium that received the top ranking and was funded by the NIMH led Human Brain Project. Dr. Paxinos has been honored with more than nine distinguished awards throughout his years of research, including: The Warner Brown Memorial Prize (University of California at Berkeley, 1968), The Walter Burfitt Prize (1992), The Award for Excellence in Publishing in Medical Science (Assoc Amer Publishers, 1999), The Ramaciotti Medal for Excellence in Biomedical Research (2001), The Alexander von Humboldt Foundation Prize (Germany 2004), and more.

Users Review

From reader reviews:

Scott Peters:

Hey guys, do you desire to find a new book to learn? May be the book with the title *Atlas of the Human Brain, Fourth Edition* suitable to you? Often the book was written by popular writer in this era. The particular book *untitled Atlas of the Human Brain, Fourth Edition* is one of several books that everyone read now. This book was inspired a lot of people in the world. When you read this e-book you will enter the new dimensions that you ever know just before. The author explained their plan in the simple way, thus all of people can easily be aware of the core of this book. This book will give you a great deal of information about this world now. To help you to see the represented of the world in this book.

Coleen Faircloth:

This *Atlas of the Human Brain, Fourth Edition* is great publication for you because the content that is certainly full of information for you who else always deal with world and have to make decision every minute. This specific book reveals facts accurately using great coordinate word or we can point out no rambling sentences included. So if you are read that hurriedly you can have whole data in it. Doesn't mean it only provides you with straight forward sentences but tough core information with lovely delivering sentences. Having *Atlas of the Human Brain, Fourth Edition* in your hand like obtaining the world in your arm, info in it is not ridiculous. We can say that no reserve that offer you world in ten or fifteen moments right but this e-book already does that. So, this is certainly good reading book. Heya Mr. and Mrs. stressfull do you still doubt that will?

Ruth Barr:

That publication can make you to feel relax. This specific book *Atlas of the Human Brain, Fourth Edition* was colourful and of course has pictures on there. As we know that book *Atlas of the Human Brain, Fourth Edition* has many kinds of genre. Start from kids until adolescents. For example *Naruto* or *Private investigator Conan* you can read and believe you are the character on there. So, not at all of book tend to be make you bored, any it makes you feel happy, fun and chill out. Try to choose the best book for you personally and try to like reading that will.

Amy Petersen:

Some individuals said that they feel fed up when they reading a e-book. They are directly felt it when they get a half regions of the book. You can choose often the book *Atlas of the Human Brain, Fourth Edition* to make your personal reading is interesting. Your own personal skill of reading expertise is developing when you similar to reading. Try to choose straightforward book to make you enjoy you just read it and mingle the feeling about book and reading through especially. It is to be initially opinion for you to like to wide open a book and read it. Beside that the guide *Atlas of the Human Brain, Fourth Edition* can to be your brand new friend when you're really feel alone and confuse in doing what must you're doing of this time.
